

五. 马尔可夫过程

1. 离散马尔可夫链

$\{X_n, n=0,1,\dots\}$ 若 $P(X_{n+1}=i | X_n=j, X_{n-1}=k, \dots) = P(X_{n+1}=i | X_n=j)$ 无后效性

若 $P(X_{n+1}=i | X_n=j) = P_{ij}$ (与 n 无关) 时齐 (本章讨论部分)

转移矩阵: $P=(P_{ij})$, 性质: 1) $P_{ij} \geq 0$ 2) $\sum_j P_{ij} = 1 \Rightarrow$ 称为随机矩阵

吸收态: $P_{ii}=1$ (只进不出)

互通: $\exists n, P_{ij}^{(n)} > 0$ 且 $P_{ji}^{(n)} > 0$ 若 $\{X_n\}$ 任两状态互通, 则 X_n 不可约

多步转移: $P(X_{n+m}=j | X_n=i) = P_{ij}^{(m)}$ 与 n 无关 (时齐)

归纳法: $P(X_{n+m+1}=j | X_n=i) = \sum_{k \in S} P(X_{n+m+1}=j | X_{n+m}=k) P(X_{n+m}=k | X_n=i) = \sum_{k \in S} P_{kj} P_{ik}^{(m)}$

$P^{(n)} = (P_{ij}^{(n)})$ 为 n 步转移矩阵, $P^{(0)} = P, P^{(1)} = I$

Chapman-Kolmogorov 方程: 对时齐马尔可夫链, $m, n \geq 0, i, j \in S$

$$1) P_{ij}^{(m+n)} = \sum_{k \in S} P_{ik}^{(m)} P_{kj}^{(n)} \quad 2) P^{(n)} = P^n$$

首次时间: $\{T_y=n\} = \{X_1 \neq y, \dots, X_{n-1} \neq y, X_n = y\}$

首次概率: 对 state $i, j, f_{ij}^{(n)}$ 为 i 步后首次到 j 的概率

$$f_{ij}^{(n)} = P(X_n=j, X_{n-1} \neq j, \dots, X_0=i)$$

$$f_{ij}^{(0)} = \delta_{ij} = \text{diag}[1, \dots, 1]$$

$\Rightarrow f_{ij} = \sum_{n=0}^{\infty} f_{ij}^{(n)}$ 为首次概率

$$P_{ii}^{(n)} = \sum_{j \in S} f_{ij}^{(n)} P_{ji}^{(n-1)}$$

$$P_{ij}^0 = P(X_0=j | X_0=i) = \sum f_{ij}$$

recurrent 常返状态: $f_{ii} = 1$ (为 P 收敛: $P(\bigcup_{n=1}^{\infty} \{X_n=i, X_0=i\}) = \sum f_{ii}^{(n)} \rightarrow 1$, 即该状态依概率收敛)

$f_{ii} < 1 \Rightarrow p = 1 - f_{ii}$ 的概率迷失

$\hookrightarrow$ 依概率能以有限步回到原位置

首次时间: $T = \inf\{n \geq 1 | X_n=i\} \Rightarrow$ 期望: $\mu_i = E(T) = \sum_{n=1}^{\infty} n f_{ii}^{(n)}$ 庞加莱周期

$\mu_i < \infty$: 正常返状态 $\mu_i = +\infty$: 零常返状态

常返性: 等价条件: $f_{ii} = 1 \Leftrightarrow \sum_{n=0}^{\infty} P_{ii}^{(n)} = \infty$

Pf: 常返 $\Rightarrow f_{ii}=1 \Leftrightarrow$ 有无穷回归 $P=1 \Rightarrow$ 无限次 $n: X_n=i \Rightarrow P(\sum I_n = +\infty | X_0=i) \Rightarrow E(\sum I_n | X_0=i) = \sum P_{ii}^{(n)} = +\infty$

$$f_{ii} < 1 \Leftrightarrow \sum_{n=0}^{\infty} P_{ii}^{(n)} < \infty, \text{ 且 } \sum_{n=0}^{\infty} P_{ii}^{(n)} = \frac{1}{1-f_{ii}}$$

非常返 $\Rightarrow f_{ii} < 1$, 取 Y : 迷失的探索次数, $EY = \frac{1}{p} = \frac{1}{1-f_{ii}}$ (几何分布)

$$\hookrightarrow Y = \sum_{n=1}^{\infty} I_n + 1 \Rightarrow E(\sum I_n | X_0=i) = \sum_{n=1}^{\infty} P_{ii}^{(n)} = E(Y) - 1 \Rightarrow \sum_{n=0}^{\infty} P_{ii}^{(n)} = E(Y) = \frac{1}{1-f_{ii}}$$

$$\sum P_{ij}^{(n)} < \infty, \lim_{n \rightarrow \infty} P_{ij}^{(n)} = 0$$

$$\text{Pf: } P_{ij}^{(n)} = \sum f_{ij} P_{ji}^{(n-1)} \leq \sum P_{ji}^{(n-1)} \Rightarrow \sum P_{ij}^{(n)} < \infty$$

$$\lim_{n \rightarrow \infty} P_{ii}^{(n)} = 0$$

done.

醉汉回家问题: d 维空间上的随机行走, 是否能回到原点?

解: 每次 $p_{ij} = \begin{cases} \frac{1}{2d} & |i-j|=1 \\ 0 & \text{else} \end{cases}$, $p_{ii}^{(1)} = 0$, $p_{ii}^{(2n+1)} = 0$ (某个方向有奇数位移)
 $p_{ij}^{(2n)} = \sum_{\substack{\sum n_i = n \\ n_i \geq 0}} \frac{(2n)!}{(n_1! n_2! \dots n_d!)} \left(\frac{1}{2d}\right)^{2n}$ (2n次中选择d个方向的移动次序)

对 $d=1$: $p_{ij}^{(2n)} = \left(\frac{1}{2}\right)^{2n} \cdot C_{2n}^n = \left(\frac{1}{2}\right)^{2n} \frac{(2n)!}{(n!)^2} \sim \frac{2^{2n+1/2} n^{2n+1/2} e^{-2n} \sqrt{2}}{2^{2n} n^{2n+1} e^{-2n} (\sqrt{2})^2} = \frac{1}{\sqrt{n\pi}}$, $\sum p_{ii}^{(n)} = +\infty$, 具有常返性

对 $d=2$: $p_{ij}^{(2n)} = \left(\frac{1}{4}\right)^{2n} \cdot C_{2n}^n \sum \left(\frac{n!}{n_1! n_2!}\right)^2 = \left(\frac{1}{4}\right)^{2n} (C_{2n}^n)^2 = \left(\frac{1}{4} \frac{(2n)!}{(n!)^2}\right)^2 \sim \frac{1}{\pi n} \Rightarrow \sum p_{ii}^{(n)} = +\infty$, 具有常返性
 $\sum C_n^a C_n^b = C_{2n}^a$ $n! \sim n^{n+1/2} e^{-n} \sqrt{2\pi}$

对 $d \geq 3$, $p_{ii}^{(2n)} = \sum \frac{(2n)!}{(n_1! \dots n_d!)} \left(\frac{1}{2d}\right)^{2n} \leq \frac{1}{2^{2n}} \frac{1}{d^n} C_{2n}^n \max\left(\frac{n!}{n_1! \dots n_d!}\right) \cdot \frac{1}{d^n} \sum \frac{n!}{n_1! \dots n_d!} \leq \frac{1}{2^{2n}} \frac{1}{d^n} C_{2n}^n \left(\frac{(n+c)!}{(\frac{n+c}{d}!)^d}\right) \sim \frac{\sqrt{2} d^{c+\frac{d}{2}}}{(2\pi n)^{\frac{d}{2}}}$
 此时 $\sum p_{ii}^{(2n)} < +\infty$, 为非常返的!
 $= \frac{1}{d^n} \cdot d^n = 1$ $\exists 0 < c \leq d-1$, 使 $n+c \leq d$, $\frac{n!}{n_1! \dots n_d!} \leq \frac{(n+c)!}{n_1! n_2! \dots (n_d+c)!} \leq \frac{(n+c)!}{(\frac{n+c}{d}!)^d}$

周期: 集合 $\{n \geq 1 \mid p_{ii}^{(n)} > 0\}$ 非空, $d = d(i)$ 为 n 的最大公约数, 为周期 $d=1$: 为非周期的, $\{n\} = \emptyset: d = \infty$, 即永不返回

遍历性 ☆

2. 平稳分布

探究 $\lim_{n \rightarrow \infty} P_{ij}^{(n)}$, 即 P^n

极限分布: 非常返/零常返: $\lim_{n \rightarrow \infty} P_{ij}^{(n)} = 0$

零常返: $P_{ij}^{(n)} \rightarrow 0, \sum P_{ij}^{(n)} = +\infty \Rightarrow P_{ij}^{(n)} \rightarrow 0$

遍历链: $\lim_{n \rightarrow \infty} P_{ij}^{(n)} = \frac{1}{\mu_j} (d=1)$

Pf: 母函数法: 令 $P_{ij}^{(n)} = p_n$, $P(z) = \sum p_n z^n = \frac{1}{1-F(z)}$, $F(z) = \sum f_{ij}^{(n)} z^n$, $\mu_j = \sum n f_{ij}^{(n)}$

□未证

周期性正常返:

1. $d=1 \Rightarrow F(z) = \sum f_n z^n$, $\mu = \sum n f_n$, $P(z) = \frac{1}{1-F(z)} = \sum p_n z^n = \sum \frac{1}{F(z)^k}$

$$\lim_{n \rightarrow \infty} P_{ij}^{(nd)} = \frac{d}{\mu_j}$$

$$p_n = \frac{1}{n!} \frac{d^n P}{dz^n}, \lim_{n \rightarrow \infty} p_n = \frac{1}{\mu_j}$$

$$\lim_{n \rightarrow \infty} P_{ij}^{(nd+r)} = f_{ij}(r) \frac{d}{\mu_j}, f_{ij}(r) = \sum f_{ij}^{(nd+r)}$$

2. $d \geq 1$ $F(z) = \sum f_n z^n = \sum f_{nd}(z^d)^n = \sum f_n^d z^n \Rightarrow \mu_d = \sum n f_n^d = \frac{1}{d} \sum n d f_n^d = \frac{\mu}{d} \Rightarrow \lim_{n \rightarrow \infty} P_{ij}^{(nd)} = \frac{d}{\mu_j}$

平稳分布: $P_i: P_j = \sum P_i P_{ij} \forall j \in S$, 记作 $\pi \Rightarrow \pi^T P = \pi^T \Rightarrow \pi = P^T \pi \Rightarrow \pi$ 为 P^T 特征向量, $\lambda=1 \Rightarrow \pi^T P^n = \pi^T$

若 X_n 有平稳分布 π , 且 $X_0 \sim \pi \Rightarrow X_n$ 严平稳. 略

极限分布: $P_{ij}^{(n)} \rightarrow \frac{1}{\mu_j} = \pi_j$, 即: 极限分布为唯一-平稳分布, $P_{ij}^{(n)} \rightarrow 0$ (非常返与零常返无平稳分布)

Pf: 为平稳: $\sum_j P_{ij}^{(n)} = 1 \Rightarrow \lim_{n \rightarrow \infty} \sum_j P_{ij}^{(n)} = 1$ 若 S 有限状态, $\sum$ 与 $\lim$ 可换: $\sum_j \pi_j = 1$

C-K 方程: $P_{ij}^{(n+1)} = \sum_k P_{ik}^{(n)} P_{kj} \Rightarrow \lim_{n \rightarrow \infty} \sum_k P_{ik}^{(n)} P_{kj} = \sum_k \pi_k P_{kj}$, done.

唯一: 设有另一-平稳分布 $\tilde{\pi}_j$, $\tilde{\pi}_j = \sum_i \tilde{\pi}_i P_{ij}^{(n)} \xrightarrow{\lim} \tilde{\pi}_j = \pi_j \sum_i \tilde{\pi}_i = \pi_j$, done.

$P_{ij}^{(n)} \rightarrow 0$: $\pi_j = \sum_i \pi_i P_{ij}^{(n)} > 0 \Rightarrow \sum \pi_i \neq 1$, done.

证明? □

遍历链 $\lim_{n \rightarrow \infty} \sum_j |P_{ij}^{(n)} - \pi_j| = 0$

Pf: $\sum_j |P_{ij}^{(n+1)} - \pi_j| = \sum_j \sum_k P_{ik}^{(n)} |P_{kj} - \pi_j| \leq \sum_k P_{ik}^{(n)} \max_j |P_{kj} - \pi_j| \leq P_{ik}^{(n)} \max_j |P_{kj} - \pi_j| \rightarrow 0$

不可约链 $\lim_{n \rightarrow \infty} \sum_j |\frac{1}{n} \sum_{k=1}^n P_{ij}^{(k)} - \pi_j| = 0$ (未)

平稳可逆分布: $P_{ij}, \pi_j \Rightarrow \pi_i P_{ij} = \pi_j P_{ji} \Rightarrow \pi_i = \pi_i \sum_j P_{ij} = \sum_j \pi_j P_{ji}$

埃伦费斯特模型：2容器A.B.可分装 $2N$ 个球。 t_0 时A含 $2N$ 个，B含0个。

周期 $d=2$ ，正常返性不可约马氏链

每次在 $2N$ 个球随机选一个换位，重复 s 步，求 $\lim_{s \rightarrow \infty}$ 的分布与厄尔米特同期

解：A容器状态 $|n\rangle$ ， $\langle n|P^s|n_0\rangle$ 为 $P(X_s=n|X_0=n_0)$ ， $\sum_n \langle n|P^s|n_0\rangle = 1$

转移矩阵： $\langle n+1|P|n\rangle = 1 - \frac{n}{2N}$ $\langle n-1|P|n\rangle = \frac{n}{2N}$ ，else $P=0$

求本征值： $P^T = \begin{bmatrix} 0 & \frac{1}{2N} & & \\ 1 & \frac{2N-1}{2N} & & \\ & \ddots & \ddots & \\ & & \frac{1}{2N} & 0 \end{bmatrix}$

$$P^T z = \lambda z \Rightarrow z = \frac{1}{|z|} \begin{bmatrix} 1 \\ \frac{2N}{2N-1} \\ \frac{2N(2N-1)}{2} \\ \vdots \end{bmatrix} = \frac{1}{2^{2N}} \begin{bmatrix} C_{2N}^n \end{bmatrix}$$

Pf: 131页

$$\begin{cases} \frac{1}{2N} z_1 = \lambda z_0 \\ z_0 + \frac{2}{2N} z_1 = \lambda z_1 \\ \vdots \\ \frac{1}{2N} z_{2N-1} = \lambda z_{2N} \\ z_n = \frac{2N}{n} (\lambda z_{n-1} - (1 - \frac{n-1}{2N}) z_{n-2}) \end{cases}$$

故为伯努利分布

平均返回时： $\lim_{n \rightarrow \infty} P_{ii}^{(2n)} = \frac{d}{\mu_i} \Rightarrow \mathcal{P}_i = \frac{1}{2}(\mu_i + \mu_{\bar{i}}) = \frac{1}{\pi_i}$ e.g: $\mathcal{P}_{2N} = \mathcal{P}_0 = 2^{2N}$

$$\lim_{n \rightarrow \infty} P_{ii}^{(2n)} = \frac{d}{\mu_i}$$

3 连续时间马尔可夫链

连续马尔可夫性: $P[X(t+s)=j | X(s)=i, \dots] = P[X(t+s)=j | X(s)=i]$

等价定义: $P[X(t_{n+1})=j | X(t_n)=i, \dots] = \sim$ 对 $\forall n$ 与 $\forall 0 \leq t_0 < t_1 < \dots < t_{n+1}$

时齐性: $P_{ij}(s,t) = P[X(t+s)=j | X(s)=i] = P_{ij}(t)$ 与 s 无关

转移矩阵: 1) $P_{ij}(t) \geq 0$ 2) $\sum_j P_{ij}(t) = 1$ 3) $P_{ij}(t+s) = \sum_k P_{ik}(t) P_{kj}(s)$

转移矩阵: 可计算生成元 $\frac{\partial P(t)}{\partial t} \Big|_{t=0} = Q P(t)$ $P(t) = \exp[Qt]$

正则: $\lim_{h \downarrow 0} X(t+h) = X(t)$ a.s. 若非正则, $\exists T$, $t \rightarrow T$ 时 $[0, T]$ 内无限次转移
轨道右连续

$$\lim_{t \rightarrow 0} P_{ij}(t) = P_{ij}(0) = \delta_{ij} \quad \text{pf: } P_i(|X(t+h) - X(t)| > \epsilon | X(0)=i) = \frac{P\{|X(t+h) - X(t)| > \epsilon, X(0)=i\}}{P(X(0)=i)} \stackrel{\text{a.s.}}{\leq} \frac{P\{\dots > \epsilon\}}{P(X(0)=i)} \rightarrow 0 \text{ for } h \rightarrow 0$$

$$\text{对 } P_{ii}(t) \Rightarrow |P_{ii}(0) - P_{ii}(t)| = 1 - P_{ii}(t) = P\{X(t) \neq i | X(0)=i\} = P\{|X(t) - X(0)| > 0 | X(0)=i\} \rightarrow 0$$

收敛性控制: $\sum_j |P_{ij}(t+h) - P_{ij}(t)| \leq \underbrace{2(1 - P_{ii}(h))}_{O(h)}$

$$\text{pf: } \sum_j |P_{ij}(t+h) - P_{ij}(t)| = \sum_j \left| \sum_k P_{ik}(t) (P_{kj}(h) - \delta_{kj}) \right| \leq \sum_j \sum_k P_{ik}(t) |P_{kj}(h) - \delta_{kj}|$$

转移速率: $Q = \frac{\partial P(t)}{\partial t} \Big|_{t=0}$ (生成元)

$$= \sum_j \left(\sum_{k \neq j} P_{ik}^t P_{kj}^h + P_{ij}^t (1 - P_{jj}^h) \right) = \sum_j \left(\sum_k P_{ik} P_{kj} + P_{ij}^t (1 - 2P_{jj}^h) \right) = 1 + \sum_j P_{ij}^{(1)} - 2 \sum_j P_{ij}^{(1)} P_{ij}^{(1)} = 2 - 2$$

严格定义: $q_{ij} = \lim_{t \downarrow 0} \frac{P_{ij}(t) - \delta_{ij}}{t} \Rightarrow q_{ii} = -q_{ij} = \sup_{t \downarrow 0} \frac{-\ln P_{ii}(t)}{t}$
 $q_{ij} = \lim_{t \downarrow 0} \frac{P_{ij}(t)}{t}$

$$\sum_{j \neq i} q_{ij} \leq q_i \quad \text{有限状态 } \sum_{j \neq i} q_{ij} = q_i \quad \text{Fatou 引理: } q_i = \lim_{t \downarrow 0} \frac{1 - P_{ii}(t)}{t} = \lim_{t \downarrow 0} \sum_{j \neq i} \frac{P_{ij}(t)}{t} \geq \sum_{j \neq i} \lim_{t \downarrow 0} \frac{P_{ij}(t)}{t} = \sum_{j \neq i} q_{ij}$$

停留时间的无记忆性: $t=0$ 时处于态 i , τ_i 为在 i 上停留时间. Claim: τ_i 满足 q_i 的指数分布

pf: 即证 $P\{\tau_i > s+t | \tau_i > s\} = P\{\tau_i > t\}$, $\{\tau_i > s\} \Leftrightarrow \{X(u)=i, 0 \leq u \leq s\} \cap \{X(s)=i\}$

则有: $P\{\tau_i > s+t | \tau_i > s\} = P\{X(u)=i \text{ for } 0 \leq u \leq s; X(u)=i \text{ for } s < u \leq s+t | X(s)=i\} = P$

对 τ_i : $P_i(h) = 1 - q_i h + o(h)$

Kolmogorov 微分方程: $\frac{\partial P}{\partial t} = \underbrace{P(t)Q}_{\text{前向方程}} = \underbrace{Q P(t)}_{\text{后向方程}}$ 单种群转移数, $[P, Q] = 0$

展开: 前向: $P'_{ij}(t) = \sum_{k \neq j} P_{ik}(t) q_{kj} - P_{ij}(t) q_i$ Fokker-Planck 方程

$$\text{后向: } p'_{ij}(t) = \sum_{k \neq i} q_{ik} p_{kj}(t) - p_{ij}(t) q_i$$

$$\text{证明: } p_{ij}(t+h) - p_{ij}(t) p_{ii}(h) = \sum_{k \neq i} p_{ik}(h) p_{kj}(t)$$

$$p_{ij}(t+h) - p_{ij}(t) = \sum_{k \neq i} p_{ik}(h) p_{kj}(t) - (1 - p_{ii}(h)) p_{ij}(t)$$

$$\lim_{h \rightarrow 0} \frac{p_{ij}(t+h) - p_{ij}(t)}{h} = \lim_{h \rightarrow 0} \sum_{k \neq i} \frac{p_{ik}(h)}{h} p_{kj}(t) - \frac{1 - p_{ii}(h)}{h} p_{ij}(t) \quad \text{for } N. \quad \liminf_{h \rightarrow 0} \sum_{k \neq i} \frac{p_{ik}(h)}{h} p_{kj}(t) \geq \liminf_{h \rightarrow 0} \sum_{k \neq i} \frac{p_{ik}(h)}{h} p_{ij}(t) = \sum_{k \neq i} \lim_{h \rightarrow 0} \frac{p_{ik}(h)}{h} p_{ij}(t) = \sum_{k \neq i} q_{ik} p_{kj}(t)$$

e.g. Poisson:

$$p_{kj}(h) = \begin{cases} 0 & j < k \\ \alpha(h) & j \geq k+2 \\ \lambda h + o(h) & j = k+1 \\ 1 - \lambda h + o(h) & j = k \end{cases}$$

$$\downarrow$$

$$q_{kj} = \begin{bmatrix} \lambda & \lambda & & \\ & \lambda & \lambda & \\ & & \ddots & \ddots \end{bmatrix}$$

$$\Rightarrow \text{前向: } p'_{ij}(t) = \lambda p_{i+1,j}(t) - \lambda p_{ij}(t) \Rightarrow p'_{ii}(t) = -\lambda p_{ii}(t) \Rightarrow p_{ii}(t) = e^{-\lambda t}$$

$$p'_{i,i+1}(t) = \lambda e^{-\lambda} - \lambda p_{i,i+1}(t) \Rightarrow \lambda t e^{-\lambda t}$$

$$p'_{i,i+k+1}(t) = \dots \Rightarrow p_{i,i+k}(t) = \frac{\lambda^k}{(k+1)!} e^{-\lambda t}$$

$$\text{Yule } p_{kj}(h) = \begin{cases} 0 & j < k \\ \alpha(h) & j \geq k+2 \\ k\lambda h + o(h) & j = k+1 \\ 1 - k\lambda h + o(h) & j = k \end{cases}$$

$$\downarrow$$

$$Q = \begin{bmatrix} \lambda & \lambda & & \\ & 2\lambda & 2\lambda & \\ & & 3\lambda & 3\lambda \\ & & & \ddots \end{bmatrix}$$

$$\Rightarrow p_{ii} = e^{-i\lambda t} \quad p_{i,i+1} = e^{-i\lambda t} (i\lambda t e^{\lambda t}) \Rightarrow p_{i,j+1}(t) = \dots$$

$$\text{生灭: } p_{ij}(h) = \begin{cases} i\lambda h + o(h) & j = i+1 \\ i\mu h + o(h) & j = i-1 \\ i(\lambda + \mu)h + o(h) & j = i \\ o(h) & \text{else} \end{cases} \quad p_{00} = 1, p_{0j} = 0 \Rightarrow \text{灭绝}$$

$$\downarrow$$

$$Q = \begin{bmatrix} i(\lambda + \mu) & & & 0 \\ & i\mu & i\lambda & \\ & & \ddots & \ddots \\ 0 & & & \end{bmatrix}$$

连续时空马尔可夫链: 状态连续 $\Rightarrow [X(t), \mathcal{F}_t], t \geq 0$, 有界 Borel 函数 $g(x)$

$$E[g(X(t)) | \mathcal{F}_s] = E[g(X(t)) | X(s) = x] \Rightarrow F(s, t; x, y) = P(X(t) \leq y | X(s) = x) \rightarrow f(s, t; x, y) = \frac{dF}{dy}$$

转移概率密度

$$\text{时齐: } F(s, t; x, y) = F(0, t-s; x, y) \Rightarrow \frac{\partial}{\partial t} f(t; x, y) = \int Q(x, k) f(t; k, y) dk = \int Q(x, k) f(t; k, y) dk$$

$$Q(x, y) = \left. \frac{df}{dt} \right|_{t=0}$$

(其余见后)

扩散模型 Diffusion: 马尔可夫性: $P(x_t | x_{t-1}, x_{t-2}, \dots) = P(x_t | x_{t-1}) \Rightarrow P(t) = e^{Qt}$, $Q = N(x_t; \sqrt{1-\beta_t} x_{t-1}, \beta_t I)$, β_t 为方差

β_t 为 t 时方差, 已预设

$$p = e^{-\frac{(u-x_t)^2}{2\beta_t}}$$

前向加噪: $P(x_t | x_{t-1}) = \sum$

x_t : state of t, data $\Rightarrow P(x_t | x_{t-1}) = P$; $P^{(n)} = P^n$, 取 $\langle x_t | P | x_{t-1} \rangle = N(x_t; \mu = \sqrt{1-\beta_t} x_{t-1}, \sigma^2 = \beta_t I)$ 高斯核

$$\langle x_T | P^n | x_0 \rangle = N$$

$$\langle x_2 | P^2 | x_0 \rangle = N_1 * N_2 = N(x_2; \mu = \sum \mu_i; \sigma^2 = 2\sigma^2) \Rightarrow \alpha_t = 1 - \beta_t$$

$$\mu = \sum \mu_i = \sqrt{\alpha_t} x_{t-1} + \sqrt{1-\alpha_t} x_{t-2} + \dots$$

$$= \sqrt{\alpha_t} x_{t-1}$$

$$\sigma^2 = 1 - \alpha_T$$

逆向: $q(x_{t-1} | x_t, x_0) = N(x_{t-1} | \tilde{\mu}_t(x_t, x_0), \tilde{\beta}_t I)$

$$p_\theta(x_{t-1} | x_t) = N(x_{t-1} | \mu_\theta(x_t, t), \Sigma_\theta(x_t, t))$$

强 Markov 性: 对于任意停时 T, $P(x_{T+n} = x | x_T, x_{T-1}, \dots)$

$$P(x_{T+1} = x | x_T = y, T=n) = p_{yx}$$

在 n 时刻停止的决策仅与 n 处信息有关

$$P(x_{T+n} = x, x_T = y, T=n) = \sum_{x \in V_n} P(x_{n+1} = x, x_T = y_0, \dots, x_T = y) = \sum P(x_{n+1} = x | x_0 = x_0, \dots) P(x_n = x_0, \dots, x_0 = x_0)$$

$$= p_{yx} \sum P(x_0 = x_0, \dots, x_0 = x_0) = p_{yx} P(T=n, x_T=y)$$
