

六. 鞅理论

1. 鞅：公平性问题：策略依赖于前结果 + 输赢期望不变.

定义： X_n, Y_n 为随机过程： $X_n = X_n(Y_0 \dots Y_n)$ ； $E|X_n| < \infty$

若 $E[X_{n+1} | Y_0 \dots Y_n] = X_n$ (进行一次 Y 不改变期望)

上下鞅：下鞅： $X_n^+ = \max[0, X_n]$, $E[X_n^+] < \infty$, $E[X_{n+1} | Y_0 \dots Y_n] \geq X_n$ 易赚

上鞅： $X_n^- = \max[0, -X_n]$, $E[X_n^-] < \infty$, $E[X_{n+1} | Y_0 \dots Y_n] \leq X_n$ 易赔

σ 代数上的定义：

$(\Omega, \mathcal{F}, P)$, $\mathcal{F}_n$ 为一列 σ 子代数, $\mathcal{F}_n \subset \mathcal{F}_{n+1}, n \geq 0 \Rightarrow \sigma$ 代数流 filtration

带流概率空间： $(\Omega, \mathcal{F}, \{\mathcal{F}_n\}, P)$ 若 X_n 是 $\mathcal{F}_n$ 可测 $\Rightarrow X_n$ 为适应的； $\{X_n, \mathcal{F}_n\}$ 为适应列

可料： X_n 关于 $\mathcal{F}_{n-1}$ 可测 代数流：逐步增加过去与现在的信息

鞅：设 $\{\mathcal{F}_n, n \geq 0\}$ 为 σ 代数流. 随机过程 $\{X_n, n \geq 0\}$ 为 $\{\mathcal{F}_n, n \geq 0\}$ 的鞅. 若 $\{X_n\}$ 为 $\{\mathcal{F}_n\}$ 适应的.

$\downarrow$ $E|X_n| < \infty, E[X_{n+1} | \mathcal{F}_n] = X_n \Rightarrow Z_n = X_n - X_{n-1}, \{Z_n\}$ 为 $\{\mathcal{F}_n\}$ 的鞅差序列

下鞅： $\sim, E[X_n^+] < \infty, E[X_{n+1} | \mathcal{F}_n] \geq X_n$

上鞅： $\sim, E[X_n^-] < \infty, E[X_{n+1} | \mathcal{F}_n] \leq X_n$

性质：1) X_n 为下鞅 $\Leftrightarrow -X_n$ 为上鞅

3) X_n, Y_n 为下鞅 $\Rightarrow \max(X_n, Y_n)$ 为下鞅

2) X_n, Y_n 为下鞅 $\rightarrow a, b > 0, aX_n + bY_n$ 为下鞅

为上鞅 $\Rightarrow \min(X_n, Y_n)$ 为上鞅

凸变换：

凸函数：若 $\forall x, y \in I, \alpha \in (0, 1), \alpha \varphi(x) + (1-\alpha)\varphi(y) \geq \varphi(\alpha x + (1-\alpha)y)$

Jensen 不等式：若 φ 为凸函数， $\mathcal{G}$ 为 $\mathcal{F}$ 的 σ 子代数，随机变量 X 满足 1) $E|X| < \infty$ 2) $E|\varphi(X)| < \infty$

$\downarrow$ 则有： $E[\varphi(X) | \mathcal{G}] \geq \varphi[E(X | \mathcal{G})]$

$\downarrow$ Claim： $\{M_n, \mathcal{F}_n\}$ 为下鞅 + $\varphi(M_n)^+ < \infty \Rightarrow \varphi(M_n)$ 为下鞅

下鞅分解定理:

若 X_n 为 $\mathcal{F}_n$ 的下鞅, $E|X| < \infty$, 则可分解为鞅 M_n , 随机变量 A_n , $X_n = M_n + A_n$

Pf: 取 $A_0 = 0$, $A_{n+1} = A_n + [E(X_{n+1}|\mathcal{F}_n) - X_n] = \sum_{k=0}^n [E(X_{k+1}|\mathcal{F}_k) - X_k]$

$\hookrightarrow A_n$ 单增, 关于 $\mathcal{F}_n$ 可测, $E A_n < \infty$

$M_{n+1} = X_{n+1} - A_{n+1} = X_{n+1} - A_n - [E(X_{n+1}|\mathcal{F}_n) - X_n] = X_{n+1} - E(X_{n+1}|\mathcal{F}_n) + M_n$; $E(M_{n+1}|\mathcal{F}_n) = E(X_{n+1}|\mathcal{F}_n) - E(X_{n+1}|\mathcal{F}_n) + M_n \Rightarrow$ 鞅

可料列和: X_i 独立随机变量, $E(X_i) > 0$

$S_n = \sum_{i=1}^n X_i$ 为下鞅 $\Rightarrow S_n = M_n + A_n = \sum_{i=1}^n (X_i - E(X_i)) + \sum_{i=1}^n E(X_i)$ ($A_n \geq 0 \Rightarrow S_n$ 为下鞅)

2. 停时理论:

随机时间: $T: \Omega \rightarrow N$, $[T \leq n] \in \mathcal{F}_n$, 称 T 为 $\{X_n, n \geq 0\}$ 的随机时间

停时: $\{X_n, n \geq 0\}$ 为随机变量, 若对 $n \geq 0$, $[T = n] \in \sigma\{X_1, \dots, X_n\}$ (在 n 时刻是否停止取决于 $X_{i=1 \sim n}$, 故 $[T = n] \in \mathcal{F}_n$)

$\hookrightarrow$ 停时的取值: T 为 $\{X_n\}$ 停时, $P(T < \infty) = 1$, ξ_n 为随机序列, $\xi_T = \xi_{T(\omega)}(\omega)$

若 $P(T < \infty) < 1 \Rightarrow Y(\omega) = \begin{cases} \xi_{T(\omega)}(\omega) & T(\omega) < \infty \\ 0 & T(\omega) = \infty \end{cases}$, 即 $Y(\omega) = \xi_{T(\omega)}(\omega) \cdot I_{\{T < \infty\}}$

首次时: $T(A) = \inf\{n: X_n \in A\}$, $T(\emptyset) = +\infty$

$\hookrightarrow T(A = n) = \{X_1 \notin A, \dots, X_{n-1} \notin A, X_n \in A\}$

性质: 1) 三者等价: $[T = n] \in \mathcal{F}_n$; $[T \leq n] \in \mathcal{F}_n$; $[T > n] \in \mathcal{F}_n$

4) T, S 为停时 $\Rightarrow T+S, \min\{T, S\}, \max\{T, S\}$ 均为停时

Pf: $[T+S = n] = \bigcup_{k=0}^n [T=k] \cap [S=n-k] \in \mathcal{F}_n$, 其余略

$\downarrow$
 $T_n = \min\{T, n\}$, $T_n = \max\{T, n\}$ 为停时 (n 为停时)

停时鞅: $\{M_n, \mathcal{F}_n\}$ 为鞅, T 为 $\mathcal{F}_n$ 停时, $P(T_n < \infty) = 1$, $T_n = \min\{T, n\}$

$Y_n = M_{T_n}$ 关于 $\mathcal{F}$ 为鞅

Pf: $Y_n = \sum_{i=1}^n M_i I_{\{T \geq i\}} + M_n I_{\{T > n\}} \in \mathcal{F}_n$, $E|Y_n| \leq \sum |M_i| + |M_n| < \infty$

$E(Y_{n+1}|\mathcal{F}_n) = \sum_{i=1}^n M_i I_{\{T \geq i\}} + E(M_{n+1} I_{\{T \geq n+1\}}|\mathcal{F}_n) + E(M_{n+1} I_{\{T > n+1\}}|\mathcal{F}_n) = \sum_{i=1}^n M_i I_{\{T \geq i\}} + \underbrace{E(M_{n+1}|\mathcal{F}_n)}_{M_n} = Y_n$, done

Wald等式: X_i 独立同分布, T 为 X_n 停时, $E(T) < \infty \Rightarrow E(\sum_{i=1}^T X_i) = E(X_1)E(T)$
证明见马氏链章节

有界停时定理: $\{M_n\}$ 为 $\{X_n\}$ 的鞅, T 为 $\{X_n\}$ 的停时, $T \leq k, \mathcal{F}_n = \sigma(X_0 \cdots X_n)$ (有界停时)

则: $E[M_T | \mathcal{F}_0] = M_0 \rightarrow E[M_T] = E[M_0]$

Pf: $T \leq k \Rightarrow M_T = \sum_{j=0}^k M_j I_{\{T \geq j\}}, E|M_T| \leq \sum E|M_j| < \infty$

对 $\mathcal{F}_{k-1}$ 条件期望: $E(M_T | \mathcal{F}_{k-1}) = E(M_k I_{\{T \geq k\}} | \mathcal{F}_{k-1}) + \sum_{j=0}^{k-1} M_j I_{\{T \geq j\}} = I_{\{T \geq k\}} \underbrace{E(M_k | \mathcal{F}_{k-1})}_{M_{k-1}} + \sum_{j=0}^{k-1} M_j I_{\{T \geq j\}}$

$\Downarrow$

$E(M_T | \mathcal{F}_{k-2}) = E(E(M_T | \mathcal{F}_{k-1}) | \mathcal{F}_{k-2}) = I_{\{T \geq k-2\}} E(M_{k-1} | \mathcal{F}_{k-2}) + \sum_{j=0}^{k-2} M_j I_{\{T \geq j\}} = I_{\{T \geq k-2\}} M_{k-2} + \sum_{j=0}^{k-2} M_j I_{\{T \geq j\}}$

$\vdots$
 $E(M_T | \mathcal{F}_0) = I_{\{T \geq 0\}} M_0 + M_0 I_{\{T=0\}} \Rightarrow E(M_T | \mathcal{F}_0) = I_{\{T \geq 0\}} M_0 + I_{\{T=0\}} M_0 = M_0$, done

(Doob 停时定理) 停时定理: 假设: $T_n = \min\{T, n\}, M_T = M_{T_n} + M_T I_{\{T > n\}} - M_n I_{\{T > n\}} \Rightarrow E(M_T) = E(M_{T_n}) + E(M_T I_{\{T > n\}}) - E(M_n I_{\{T > n\}})$
 已知 $E(M_{T_n} | \mathcal{F}_0) = M_0$ $P(T < \infty) = 0$ $E(M_T) < \infty$ 不一定满足. e.g. 第 n 次用 2^n 元赌

条件: 1) $P(T < \infty) = 1$ 2) $E(M_T) < \infty$ 3) $\lim_{n \rightarrow \infty} E(|M_n| I_{\{T > n\}}) = 0$

结论: $E(M_T | \mathcal{F}_0) = E(M_0)$ Pf 略

$\hookrightarrow$ claim: 若 1) + $\exists$ 随机变量 $Y \geq 0, E(Y) < \infty, |M_n I_{\{T > n\}}| \leq Y \rightarrow$ 停时定理亦成立

若 1) + $E(M_n^2) \leq b < \infty$ 成立 Pf: $E(M_n^2 I_{\{T > n\}}) \leq E(M_n^2) \leq b \rightarrow \sum_{k=1}^{\infty} E(M_k^2 I_{\{T > k\}}) = E(M_T^2) \leq b \rightarrow E|M_T| \leq E(M_T^2)$
 $E(M_{T_n}^2 \sum_{j=0}^n I_{\{T \geq j\}}) = \sum_{j=0}^n E(M_j^2 I_{\{T \geq j\}})$

上鞅停时定理:

故 $E(|M_n| I_{\{T > n\}}) \leq \sqrt{E(M_n^2) P(T > n)} \leq \sqrt{b P(T > n)} \rightarrow 0$

M_n 为上鞅, $W > 0, E[W] < \infty, M_{T_n} \geq -W \Rightarrow E[M_0] \geq E[M_T]$

e.g. 赌徒破产理论: 2 人对赌总金为 $N, X_0 = a, |X_{n+1} - X_n| = 1$, 输光/达到 N 时停时, $T = \min\{j: X_j = 0 \text{ 或 } X_j = N\}$

$\{0\}$ 与 $\{N\}$ 为常返态 $\rightarrow P(T < \infty) = 1$

赌资 X_n 为鞅: $E(X_{n+1} | \mathcal{F}_n) = \frac{1}{2}(X_n + 1) + \frac{1}{2}(X_n - 1) = X_n \Rightarrow$ 停时定理, $E[X_T] = X_0 = a$

$\Downarrow$
 $P(X=0) = \frac{N-a}{N}, P(X=N) = \frac{a}{N}$

故: 永远不要和庄家一直赌!

- 一致可积性: $\forall \epsilon > 0, \exists c, E[|X_n| I_{|X_n| > c}] < \epsilon$. 或 $\lim_{c \rightarrow \infty} \sup_{n \geq 1} E[|X_n| I_{|X_n| > c}] = 0$

↓ 可推出

绝对连续性: $\lim_{P(A) \rightarrow 0} \sup_{n \geq 1} E[|X_n| I_A] = 0$

Claim: X_n 绝对连续 + $\sup_{n \geq 1} E|X_n| < \infty \iff X_n$ -致可积

Pf: ($\rightarrow$) X_n 绝对连续 + $\sup E[|X_n| I_A] = B < \infty$. 取 $\delta = \frac{\epsilon}{2c}$, $P(A) < \delta$ 时取 $c = \frac{B}{\delta}$, $P(|X_n| > c) \leq \frac{E[|X_n|]}{c} \leq \frac{B}{c} \Rightarrow \sup E[|X_n| I_{|X_n| > c}] < \epsilon$, done

($\leftarrow$) X_n -致可积 $\Rightarrow$ 对 A , $\sup_{n \geq 1} E[|X_n| I_A] = \sup E[|X_n| I_A I_{|X_n| > c}] + \sup E[|X_n| I_A I_{|X_n| \leq c}]$
 $\leq \sup E[|X_n| I_{|X_n| > c}] + E[c I_A]$

$\Rightarrow \exists c, \sup E[|X_n| I_{|X_n| > c}] < \frac{\epsilon}{2}$, 取 $\delta = \frac{\epsilon}{2c}$, $P(A) < \delta$ 时原式 $\leq \frac{\epsilon}{2} + \frac{c\epsilon}{2c} = \epsilon$. done

3. 鞅收敛定理

上鞅: 对下鞅 $X_n, n \geq 0$, 给定区间 (a, b) , 令 $\beta_0 = 0$. $\forall k \geq 1, \alpha_k = \inf\{m \geq \beta_{k-1} \mid X_m \leq a\} \rightarrow U_n = \sup\{k \mid \beta_k \leq n\}$ 上鞅数
 $\beta_k = \inf\{m \geq \alpha_{k-1} \mid X_m \geq b\}$

Doob 上鞅不等式: $E[U_n(a, b)] \leq \frac{E[(X_n - a)^+] - E[(X_0 - a)^-]}{b - a} \leq \frac{E|X_n| + |a|}{b - a}$

Pf: $\{\alpha_i = n\} = \bigcap_{i=1}^{n-1} \{X_i > a\} \cap \{X_n \leq a\} \in \mathcal{F}_n$
 $\{\beta_i = n\} = \bigcap_{i=1}^{n-1} \{\alpha_i = m, X_k < b\} \cap \{X_n \geq b\} \in \mathcal{F}_n$ $\rightarrow a, b$ 为停时

构造停时列: $H_n = \begin{cases} 0 & \text{else} \\ 1 & \alpha_k < n < \beta_k \end{cases}$, 下鞅 $Y_n = a + (X_n - a)^+$

下证 $(b-a)U_n \leq (H \cdot Y)_n$: Pf: $H_n = \sum_{i=1}^n 1_{\{\alpha_i < n < \beta_i\}} \Rightarrow (H \cdot Y)_n = \sum_{i=1}^n H_n (Y_n - Y_{n-1}) = \sum_{i=1}^n \sum_{j=1}^n 1_{\{\alpha_i < n < \beta_i\}} (Y_n - Y_{n-1}) = \sum_{i=1}^n (Y_{\beta_i} - Y_{\alpha_i}) \geq (b-a)U_n$

故: $E(U_n) \leq \frac{E(H \cdot Y)_n}{b-a}$, $E(H \cdot Y)_n = E(Y_n - Y_0) - E((1-H)Y)_n$, $E((1-H)Y)_n \geq E(E((1-H)Y)_n | \mathcal{F}_n) = E((1-H)Y)_0 = 0$

$E(U_n) \leq \frac{E(H \cdot Y)_n}{b-a} \leq \frac{E(Y_n - Y_0)}{b-a} = \frac{E[(X_n - a)^+] - E[(X_0 - a)^-]}{b-a}$
 $\frac{E[(X_n - a)^+] - E[(X_0 - a)^-]}{b-a} \leq \frac{E|X_n| + |a|}{b-a}$, done

$\{M_n, n \geq 0\}$ 为关于 $\{X_n\}$ 的下鞅, $\exists 0 < C < \infty, E|M_n| \leq C$.

则当 $n \rightarrow \infty$ 时, $\{M_n\} \xrightarrow{a.s.} -$ 随机变量 M

Pf: $(M_n - a)^+ \leq M_n + |a|$, $0 \leq E|U_n| \leq E U_n \leq \frac{E|M_n| + |a|}{b-a} < \infty \Rightarrow EU = \sup_n EU_n < \infty$. $U_n \xrightarrow{a.s.} U$

故 M_n 不穿 $(a, b) \Rightarrow P(\inf M_n < a < b < \sup M_n) \rightarrow 0$ for $\forall a, b > 0 \rightarrow$ 对 $\forall a, b$ 关于 $\inf$ 与 $\sup$ 中 $\rightarrow \inf = \sup \rightarrow$ 收敛为 M

$$E|M| \leq \limsup E|M_n| < \infty, E|M| < \infty, \text{ done}$$

鞅收敛: M_n 为鞅, $E(M_n)^2 < \infty \Rightarrow$ 收敛于 M , $E[M] = E[M_0]$

鞅收敛仅要求 $E|M_n| < \infty$, 未要求 M_n -致可积 ($E[M_n]I_{|M_n|>c_3} \rightarrow 0$)

e.g. $P[X_i = \frac{1}{2}] = P[X_i = -\frac{1}{2}] = \frac{1}{2}$, $M_n = \prod_{i=1}^n X_i$, $M_0 = 1 \Rightarrow E[X_i] = 1 \Rightarrow E[M_{n+1}|\mathcal{F}_n] = E[X_{n+1}]M_n = M_n \Rightarrow$ 鞅

$E|M_n| = \prod E|X_i| = 1 < \infty \Rightarrow$ 鞅收敛, $M_n \rightarrow M$, $E(M) = E[M_0] = 1$

一致可积性: $E[\ln X_i] = \frac{1}{2} \ln \frac{3}{4} < 0$, $\frac{1}{n} \ln M_n \xrightarrow{a.s.} \frac{1}{2} \ln \frac{3}{4}$, 故 $M_n \xrightarrow{a.s.} 0$ } $\Rightarrow$ 故 $E[M_n]I_{|M_n|>c_3} \not\rightarrow 0$

4. 连续鞅

$(\Omega, \mathcal{F}, P)$ 为完备概率空间, $[\mathcal{F}(t), t \geq 0]$ 为 δ -代数流, 若 $X(t)$ 关于 $\mathcal{F}(t)$ 可测 $\rightarrow [X(t)]$ 为 $[\mathcal{F}(t)]$ 适应的 $E|X(t)| < \infty$

鞅: $E[X(t) | \mathcal{F}(s)] = X(s)$ a.s.

若 $\mathcal{F}(t)$ 仅与 $X(u)$ 有关 ($\mathcal{F}(t) = \sigma[X(u), 0 \leq u \leq t]$) $\Rightarrow E[X(t) | X(u), 0 \leq u \leq s] = X(s)$

上下鞅: 略

停时: $\tau > 0$, $P(\tau < \infty) = 1$, 对 $t \geq 0$, $[\tau < t]$ 为 $[\mathcal{F}(u)]$ 可测 有界: $\exists k, P(\tau < k) = 1$

有界停时 $\rightarrow E(X_\tau) = E(X_0)$ 停时: $E[X(t) | I_{\{\tau < t\}}] \rightarrow 0$ 时, $E[X_\tau] = E[X_0]$

鞅收敛: $\lim_{t \rightarrow \infty} X(t) = X$ a.s., $E|X| < \infty$ a.s. ?]
